The reason most of us sit behind our laptops all day is because we want to check in on Facebook, Twitter, Google Plus, and YouTube, because we want to stay current on what our friends, colleagues, and the media are talking about, and because we want to see what cool stuff people are sharing online. That's why most of us would be annoyed if the people at Google interfered with our online experience by sending us only the most relevant information. But it turns out that Google actually did just that: it created Google Now, a sort of smartphone-based artificial intelligence that could actually sense your real-life activities and use that information to serve up the most relevant information as you go about your day. At a press event today at the Yerba Buena Center for the Arts in San Francisco, Google's senior vice president of search technologies, Amit Singhal, demonstrated the feature for the first time. "Go ahead, start your day with the right information at the right time," he told the crowd. It's a tool that will be available to Android users over the coming months, he said. The service will debut on the Nexus 7 tablet, Google's second 7-inch Android tablet, which is scheduled to ship in October.

Women and AIDS: a challenge for the 21st century. Since the start of the HIV epidemic, gender relations have been affected by AIDS. Women and men have been affected differently, with women often having less control over their sexual and reproductive life and greater risks of maternal to child transmission. Women have also been hit harder by AIDS, in terms of their HIV risk, HIV status and the relationship with their sexual partners. However, to date, women have been excluded from the response to HIV/AIDS. The inclusion of women is now an essential requirement for the success of AIDS prevention and control strategies and women should be involved as equal partners in all aspects of research, development and implementation.

Thoracic and lumbar spinal cord compression in patients with chronic lymphocytic leukemia (CLL). To present spinal cord compression (SCC) as a rare but important complication of CLL, and provide a retrospective study of 14 patients. The authors conducted a retrospective review of all consecutive patients treated for CLL from 2003 to 2008 in 2d92ce491b
